

## ABSTRACT

In an optical switch including an input block in which light is incident; an output block for transferring input light from the input block; and a reflector for  
5 performing a switching operation by reflecting input light from the input block, wherein the input block and the output block are arranged so as to make input light from the input block and reflected light reflected on the reflector and transferred to the output block have an acute angle less than 90 degrees, and accordingly an optical switch capable of simplifying an assembly process and a package process  
10 and reducing a size of an optical switch package can be provided.
